## 1. 概述

NY5P系列產品為多功能單晶片CMOS語音合成4位元微控制器，是九齊科技為了支援 NY5A, NY5B, NY5C 系列 MaskROM 產品所專門開發的嵌入式EPROM架構的OTP IC (One Time Programmable)。提供4通道的語音/Midi合成功能，語音合成方式採用先進的高音質ADPCM演算法，最高採樣率可達CD音質44.1KHz，且硬體有16階的音量控制。提供兩種聲音輸出方式可供選擇，一種PWM輸出和一種DAC輸出。使用RISC精簡指令集架構，共有48條指令，除了少數指令需要2個時序，大多數指令都是1個時序即可完成，可以很方便的以程式控制來完成不同的應用。利用精準的+/- 0.5%內阻震盪，客戶可以不需外加震盪電阻。提供待機模式(Halt mode)，可大幅度的節省功耗；另外還提供慢速模式(Slow mode)，可以降低功耗。

## 5. MEMORY ORGANIZATION

There are maximum 3024K words EPROM, 224 nibbles of RAM and 22 nibbles of dedicated system control register. The registers are divided into 14 nibbles of system registers and 8 nibbles of memory registers. Besides, there are several registers without address allocation, and they can only be accessed by the special instructions. One of the registers is RAM page register (PG), and the others are audio control registers.

### 5.1 ROM

A large program/data/voice single ROM is provided, and its structure is shown below. The reserved region contains system information and can't be utilized by users. The program page is limited by the unconditional branch instruction: JMP and CALL. Because it can only handle 14-bit length address of ROM, the program page size is 16K words.

### 5.2 RAM

Each page of RAM contains 56 nibbles, and NY5P serial provides 224 nibbles of 4 pages. The page number (PG) register of RAM defined by the MPG instruction, and its initial value is 0. Because the memory space is shared with the memory registers (address=0x00~0x07), the address for RAM is 0x08~0x3F.

In addition to the immediate addressing mode, the indexed addressing mode is also supported. The page and address of the indexed RAM should be stored into RPT1 and RPT0 first, and users can read from or write in the XMD memory register to realize the indexed ROM access.

## 6. CLOCK GENERATOR

The clock generator is a Ring oscillator, and users can select the internal resistor (INT-R). A precise INT-R oscillator is provided, and its accuracy is up to  $\pm 0.5\%$ .

## 7. IO PORTS

There are most 32 I/O ports, designated as PAx through PHx, and x=0~3. All the I/O ports can be configured as input, output, or IO port (bi-direction). For the input port, we provide an internal pull-high resistor option for convenience. For the output port, users can also option its initial value as low or high according to your application circuit. Besides, users can also enable the large current option for each output port to get a larger sink current. The bi-direction IO port can be an input or output by its register value, and users can option the bi-direction IO with a pull-high resistor or without a pull-high resistor (Open-Drain). When the register equals 0, it is an output and can only output zero. When the register equals 1, it is a weak pull-high or floating (Open-Drain) so that it also can be considered as an input port with/without a pull-high resistor. Users also can enable the large sink current option of an IO port.

The PX0 port means the PA0, PB0, PC0, PD0, PE0 or PF0 port can also be optioned as an external reset pin or an infrared (IR) output pin. A reset port can possess a pull-high resistor or not, and an IR port can be initial low or high and also large sink current or not.

The pull-high resistor of all the I/O ports has two kinds of option: weak and strong. The weak one is about  $850K\Omega @3V$  for normal application and the strong one is about  $430K\Omega @3V$  usually for key matrix function. When users configure the weak or strong pull-high resistor, the pull-high resistors of all I/O ports are set as the option value.

## 8. AUDIO SYNTHESIZER

There are 1-ch voice and 2-ch or 4-ch speech/Midi, and all modes are auto-played back by hardware. Different channel mode possesses different hardware structure. It provides a hardware mixer to mix the channel data. The mixer contains a mixer control register MIX. 1-ch ~ 4-ch voice and/or Midi are all configurable by programming the MIX Two audio output stages: DAC and PWM are supported.

### 8.1 Voice

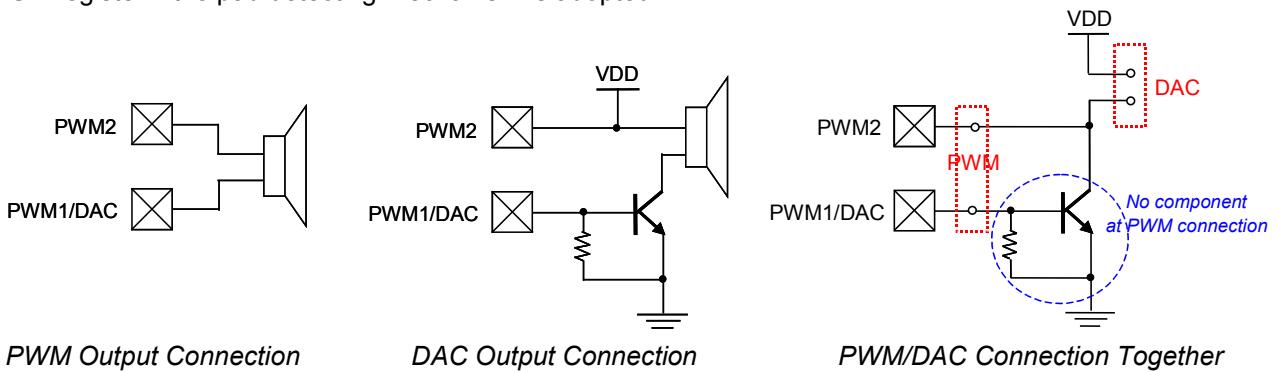

A voice channel includes a PFLG, a VPR, a voice decoder, a QIO control code generator and an 8-bit sample rate timer (TM) whose timer clock source (TCS) is fixed to 1MHz. It supports PCM and encoded ADPCM speech data.

## 8.2 Midi

A Midi channel includes a PFLG, a VPR, a TM, an ENV, a timbre skipper and a multiplier, which multiplies the Midi data and the envelope value held by the ENV. The timbre skipper is used to fulfill the higher octave pitch playing. The hardware multiplier is dedicated to the Midi channel, and users can't operate it by any instruction.

## 8.3 Audio Output

By setting the AUD register, PWM or DAC can be easily chosen as the audio output stage. Besides, it provides a pad detecting mechanism. The pad detecting mechanism detects the PWM2 pad during the reset initialization period, and sets the initial value of the audio output register as PWM if the PWM2 connection is floating, or sets the initial value of the audio output register as DAC if the PWM2 connection is high. In conclusion, connect the speaker to PWM1 and PWM2 only if using PWM, otherwise connect PWM2 to VDD if using DAC. Since the mechanism sets only the initial value of AUD, don't change the value of the AUD register if the pad detecting mechanism is adopted.

When using the PWM output, we provide an option of normal PWM current or large PWM current for different customer demand. The large PWM consumes more current and makes sound louder.

## 8.4 Volume Control

PWM supports 16 steps hardware volume control by the VOL register. (*5PxxxJ Not supported for in DAC mode.*)

## 9. ELECTRICAL CHARACTERISTICS

### 9.1 Absolute Maximum Rating
